

Screenshot 1 — HCI Focus (Tinkercad, 3D Design Interface)

HCI ELEMENTS

1 Orientation (View) Cube

Click a face to snap the camera to a standard view — a direct way to reorient.

2 Zoom +/- Controls

Large, high-contrast buttons that clearly signal “clickable” for a common action.

3 Shape Gallery + Search

Drag-and-drop panel with search, letting users recognize shapes instead of recalling names.

Reflection 2 — HCI Improvement: I would add clearer labels or tooltips to the main navigation controls. This would help beginners understand the purpose of each control more quickly.

Screenshot 2 — CG Focus (Tinkercad, 3D Design Interface)

CG ELEMENTS

1 3D Primitive Meshes

Each shape is a polygon mesh — vertices and faces defining a 3D solid.

2 Shading & Specular Highlight

The sphere's light-to-dark gradient and highlight simulate a light source, reading as "round".

3 Perspective Grid (Workplane)

Grid lines converge toward the horizon, signaling a perspective camera and depth.

Reflection 1 — CG Quality: Shading and perspective help shapes read as real 3D objects, so size and overlap are judged intuitively. However, perspective distortion can hinder precision work because edge objects may appear skewed, complicating exact alignment.
